

We are unable to publish the report due to memory out error while publishing. We are able to run the entire(execute) code and produce all the required images. Hence we are providing a custom report.

%% Part-(a) Foreground Mask using Thresholding
%
threshold = 15;
[~,~] = myForegroundMask(threshold);
```

%% Part-(b) Linear Contrast Stretching

% Contrast stretching isn't effective on the image '../data/church.png'
 % because, our contrast stretching is linear. In linear contrast
 % stretching, one maps the range of intensities in each of the red, blue
 % and green channels to the complete range [0,255]. If it so happens that
 % even one pixel of the channel has a 0 intensity and one pixel has 255
 % intensity, there will be no contrast stretching happening. This can be
 % disadvantageous when we have very few pixel at the extremes of the
 % intensity range - as is the case with the church image.

```
[image] = imread('../data/barbara.png');
[~] = myLinearContrastStretching(image);
[image] = imread('../data/TEM.png');

[image] = imread('../data/chestXray.png');
[~] = myLinearContrastStretching(image);
statue_img = imread('../data/statue.png');
```

```
threshold = 15;  
mask = (statue_img>threshold);  
masked_img = statue_img.*uint8(mask);  
[~] = myLinearContrastStretching(masked_img);
```

```
%% Part-(c) Histogram Equalization
% The histogram equalization method used here works better than the
% linear contrast stretching for the './data/church.png' image because
% the histogram equalization method can also perform non-linear contrast
% stretching suitable for the image.
[image] = imread('./data/barbara.png');
[~] = myHE(image);
[image] = imread('./data/TEM.png');
